

TABLAS DE VALORES DE MOMENTOS ANGULARES  
Y CUADRUPOLOS ELECTRICOS DE ESTADOS  
ASOCIADOS CON LA INTERACCION  
CUADRUPOLO-CUADRUPOLO EN  
UN OSCILADOR ARMONICO

RESUMEN

*In this paper we give tables for the energy levels for a system of  $N$  particles in a harmonic oscillator common potential with a quadrupole-quadrupole interaction. Each level is identified by the value of the energy of the reduced two particle state  $\rho$ , its pseudo spin  $f$ , its total angular momentum  $\lambda$  and its quadrupole moment  $\omega'$ . We also give a graph for the levels associated with values  $E = 0, 1, \dots, 12$  of the energy of the harmonic oscillators. The tables and graphs are based on the theory for the quadrupole-quadrupole interaction developed by V. Bargmann and M. Mosinsky.*

En una serie de trabajos V. Bargmann y M. Moshinsky<sup>1,2</sup> han analizado el problema de los posibles niveles de energía de un sistema de  $N$  partículas en un potencial de oscilador armónico con una interacción de tipo cuadrupolo-cuadrupolo. En unidades en las que

$$\hbar = m = \omega = 1 \quad (1)$$

siendo  $\hbar$  la constante de Planck entre  $2\pi$ ,  $m$  la masa de la partícula y  $\omega$  la frecuencia del oscilador, la energía  $\epsilon$  del estado queda de acuerdo con la mencionada teoría dada por:

$$\epsilon = E + \frac{A}{6\mathcal{I}} \quad (2)$$

donde  $E$  representa estados de energía del oscilador armónico sin interacción,  $E = 0, 1, 2, \dots$ ,

$$A = -\rho(\rho + 6) - 12f(f + 1) + 3\lambda(\lambda + 1) \quad (3)$$

$\mathcal{I}$  es una constante con significado de momento de inercia.

Los parámetros  $\rho$ ,  $f$  se ligan con la energía  $E$  por medio de las siguientes relaciones:

$$\rho = E, E - 3, E - 6, \dots \begin{matrix} 2 \\ 1 \\ 0 \end{matrix} \quad (4)$$

$$f = \frac{\rho}{2}, \frac{\rho}{2} - 1, \dots \begin{matrix} \frac{1}{2} \\ 0 \end{matrix} \quad (5)$$

$\lambda$  representa momentos angulares totales del sistema.

Uno de los puntos básicos de la teoría consiste en encontrar los valores de  $\lambda$  compatibles con los de la energía  $\rho$  y pseudo spin  $f$ , en la ecuación (3).

En el segundo de los trabajos mencionados<sup>2</sup> se demostró que los valores  $\lambda$  podían obtenerse usando de las desigualdades:

$$\begin{aligned} 0 < 2q < K_2 \\ K_2 - \lambda < 2q < K_1 - \lambda \end{aligned} \quad \text{si } K_1 - \lambda \quad \text{par} \quad (6)$$

$$\begin{array}{ll}
0 \leq 2q \leq K_2 - 1 & \text{si } K_1 - \lambda \text{ non} \\
K_2 - \lambda \leq 2q \leq K_1 - 1 - \lambda & \text{non}
\end{array} \quad (7)$$

donde

$$K_1 = \frac{\rho}{2} + f, \quad K_2 = \frac{\rho}{2} - f$$

Son compatibles únicamente valores de  $\rho$ ,  $f$ , y  $\lambda$  que den valores enteros de  $q$  que satisfagan las desigualdades (6) ó (7).

Para los valores de  $q$  obtenidos mediante las desigualdades (6) ó (7) se puede construir una matriz  $\beta_{q'q}$  definida de la siguiente manera:

$$\beta_{q-1,q} = -2q(\lambda - K_2 + 2q)(\lambda - K_2 + 2q - 1) \quad (8a)$$

$$\beta_{q+1,q} = (K_2 - 2q)(K_2 - 2q - 1)(K_1 - \lambda - 2q) \quad K_1 - \lambda \text{ par} \quad (8b)$$

$$\begin{aligned}
\beta_{qq} = & (K_2 - 2q)^2(K_1 + 1) + (K_2 - 2q)(\lambda - K_2 + 2q)(\lambda + 4q + 1) + (K_2 - 2q) + \\
& + K_2\lambda - \frac{1}{3}(K_1 + K_2 + \frac{3}{2})\lambda(\lambda + 1) \quad (8c)
\end{aligned}$$

$$\beta_{q-1,q} = -2q(\lambda - K_2 + 2q)(\lambda - K_2 + 2q - 1) \quad (9a)$$

$$\beta_{q+1,q} = (K_2 - 2q - 1)(K_2 - 2q - 2)(K_1 - \lambda - 2q - 1) \quad K_1 - \lambda \text{ non} \quad (9b)$$

$$\begin{aligned}
\beta_{qq} = & (K_2 - 2q - 1) [(2K_1 + 2\lambda + 3) + (K_2 - 1 - 2q)(K_1 - 1) + (\lambda - K_2 + 2q)(\lambda + 4q)] + \\
& + (K_1 + 1) + (K_2 - 1)(\lambda - 1) - \frac{1}{3}(K_1 + K_2 + \frac{3}{2})\lambda(\lambda + 1) \quad (9c)
\end{aligned}$$

$$\beta_{q'q} = 0 \quad \text{si } q' \neq q \pm 1, q$$

De los valores  $\|\beta_{q'q}\|$  puede construirse la ecuación secular

$$\det. (\beta_{q'q} - \omega \delta_{q'q}) = 0 \quad (10)$$

y de aquí obtener los eigenvalores de  $\omega$  asociados con el operador  $\Omega$  definido en la referencia 2.

Finalmente es posible mostrar que el momento cuadrupolar del estado  $\rho, f, \lambda$  que designaremos por  $\omega'$ , está relacionado con  $\omega$  por la fórmula

$$\omega' = \omega \frac{6}{(\lambda + 1)(2\lambda + 3)} \quad (11)$$

En la tabla I se dan los valores  $\lambda, \omega, \omega'$ , compatibles con una  $\rho, f$  dadas usando (5, 6, 7, 10, 11). La primera columna da la  $\rho$ , la segunda  $f$ , la tercera  $\lambda$  obtenida de (6) ó (7) y la cuarta de la  $A$  definida en (3). La quinta columna da la  $\omega$  obtenida de la ecuación secular (10). Si sólo hay una  $q$  posible, se tiene que  $\omega = \beta_{qq}$ . La sexta columna da la  $\omega'$  definida por (11) en términos de fracciones simples o raíces cuadradas de fracciones simples. Finalmente, la séptima columna da  $\omega'$  en términos de fracciones decimales. Se calculan todos los valores hasta  $\rho = 12$ .

En la tabla II se dan los valores  $\beta_{q'q}$  en el caso que hay dos valores de  $q$  compatibles con  $\rho, f, \lambda$  determinados, indicando en las primeras tres columnas  $\rho, f, \lambda$  respectivamente. En la cuarta columna se indican los dos valores  $q_1, q_2$  compatibles con el triplete  $(\rho, f, \lambda)$  y en la quinta columna se dan las matrices  $\beta_{q'q}$  en el orden indicado de los elementos.

En la tabla III se da el valor de  $\beta_{q'q}$  para el único caso que se presenta para  $\rho \leq 12$  en que hay tres valores de  $q$ .

Las tablas que se presentan son de importancia para determinar los niveles de energía, momentos angulares y cuadrupolos eléctricos de los estados asociados a la interacción cuadrupolo-cuadrupolo.

Además de las tablas se presenta una gráfica de niveles de energía que se calculan con ayuda de la fórmula (3). Las diferentes columnas de la gráfica corresponden a  $E = 0, 1, 2, \dots, 12$ . Para cada una de estas columnas la  $\rho$  está dada por (4), la  $f$  por (5) y la  $\lambda$  está dada en la 3a. columna de la tabla I. Para esos valores de  $\rho, f, \lambda$  se calcula  $A$ , tomando el valor más bajo de  $A$  a lo largo de la línea marcada con 0. Cada uno de los niveles está marcado por un triplete  $(\rho, f, \lambda)$  y se indica el número de valores  $q$  correspondientes (cuando son más de uno) por el exponente 2, 3, etc. En algunos casos el mismo nivel corresponde a más de un triplete.
