

TRANSFORMATION MATRICES BETWEEN THE  
 $U_3 \supset U_2$  AND  $U_3 \supset O_3$  CHAINS\*

(Recibido: febrero 20, 1969)

ABSTRACT: The transformation matrices between the bases for irreducible representations of the  $U_3$  group classified by the  $U_3 \supset U_2 \supset U_1$  (canonical) and the  $U_3 \supset O_3 \supset O_2$  (orbital) chain decompositions have been computed directly. The results, for all representations up to order six are presented in a table as (square roots of) rational numbers.

When a set of wave functions describing a system is separable in two different coordinate systems<sup>1</sup>, as eigenfunctions of two group chains, the system possesses a higher symmetry group containing both. The separability of the Coulomb potential in spherical and paraboloidal coordinates<sup>2</sup> classifies them by the irreducible representation (IR) labels of the  $O_4 \supset O_3 \supset O_2$  and  $O_4 \cong O_3 \times O_3 \supset O_2 \times O_2$  group chains respectively.<sup>4</sup> The transformation matrices between these two bases is an  $O_3$  Clebsch-Gordan coefficient. The importance of the  $U_3 \supset U_2 \supset U_1$  (canonical) and the  $U_3 \supset O_3 \supset O_2$  (orbital) chains has been seen in nuclear physics<sup>3,4,5</sup>. Elementary particle theory has used mainly the first chain (where  $U_2$  is the isospin subgroup); however, some quark-model calculations<sup>6</sup> related to harmonic oscillators require the transformation brackets between the two. It is therefore worthwhile to have a compact table of the transformation matrices between the two bases.

Although closed (but rather cumbersome) expressions exist<sup>7</sup> for these matrices, it seems that no table has yet been compiled. The present values have been computed using a Fortran program<sup>8</sup> which handles bases for group representations of unitary or linear groups. Known techniques<sup>9</sup> were used in order to generate the complete basis of  $U_3$  in the canonical chain. In the orbital chain the operators which lower the  $O_3$  IR contained in  $U_3$  (keeping it of highest weight in  $O_3$ )<sup>5</sup> and of  $O_2$  contained in  $O_3$ , were programmed and applied to the highest weight state in order to obtain the complete basis in this chain. It is known that there exist ambiguities concerning the operator which distinguishes between the basis vectors when there is more than one  $O_3$  IR contained in the  $U_3$  one. We have made no attempt in using the known discriminating operators, but in the only case when such a degeneracy occurred (for the  $[4, 2, 0]$  IR), orthogonal states were obtained in the lowering process.

We present in Table I, for convenience, the relations between the generators of both chains as well as the eigenvalues of the diagonal ones between Gel'fand kets in the canonical chain, and the definition of the states classified by the orbital chain. The quantum numbers used in particle physics<sup>10</sup> are also included. In Table II, we give the  $O_3$  IR's<sup>3</sup> contained in the tabulated  $U_3$  representations. The transformation matrices appearing in Table III were computed directly through the scalar product between the states obtained by lowering along the two chains.

The transformation matrix element

$$\left\langle \begin{array}{ccc} b_1 & b_2 & b_3 \\ L & \gamma & M \end{array} \right| \begin{array}{ccc} b_1 & b_2 & b_3 \\ q_1 & q_2 & r \end{array} \right\rangle$$

is to be found under the heading  $[b_1, b_2]$ , the row- and column-indices being  $L\gamma M$  and  $q_1, q_2, r$ , respectively. The label  $\gamma$  is absent when the value  $L$  appears only once. The entry  $\pm n/m$  is to be read as  $\pm \sqrt{n/m}$ .

The numerical calculation was performed at the Tel-Aviv Computation Centre.

TABLE I.

$U_3$  generators:  $C_j^k, j, k = 1, 2, 3$

$U_2$  generators:  $C_j^k, j, k = 1, 2$

$U_1$  generator:  $C_1^1$ .

Commutation relations

$$[C_j^k, C_m^n] = \delta_m^k C_j^n - \delta_j^n C_m^k.$$

To the partition  $[b_1, b_2, b_3]$  corresponds the Young diagram

The Gel'fand state

belongs to the IR

TABLE I

(continued)

 $[b_1, b_2, b_3]$  of  $U_3$  $[q_1, q_2]$  of  $U_2$ and  $[r]$  of  $U_1$ .This ket is eigenstate of the weight generators  $C_j^j$  with eigenvalues

$$w_1 = r$$

$$w_2 = q_1 + q_2 - r$$

$$w_3 = b_1 + b_2 + b_3 - q_1 - q_2$$

Restriction to  $b_3 = 0$  yields IR's of  $SU_3$ .

The harmonic oscillator state

$$\left| \begin{array}{ccc} n & 0 & 0 \\ & n_{12} & 0 \\ & & n_1 \end{array} \right\rangle$$

has  $n$  energy quanta, eigenvalue of

$$C_1^1 + C_2^2 + C_3^3,$$

 $n_{12}$  quanta in the 1-2 plane and  $n_1$  quanta along the 1-axis.The state belonging to the  $(m, n)$   $SU_3$  multiplet, isospin  $I$ ,  $z$ -component  $I_z$  and hypercharge  $Y$ , is denoted, in particle physics, by

TABLE I  
(continued)

$$\left. \begin{array}{cc} m & n \\ I + \frac{Y}{2} + \frac{m+n}{3} & -I + \frac{Y}{2} + \frac{m+n}{3} \\ I_z + \frac{Y}{2} + \frac{m+n}{3} & \end{array} \right\} 0$$

$O_3$  generators

$$L_0 = C_1^1 - C_3^3$$

$$L_+ = -C_1^2 - C_2^3$$

$$L_- = C_2^1 + C_3^2 .$$

Commutation relations

$$[L_0, L_{\pm}] = \pm L_{\pm}, \quad [L_+, L_-] = -L_0 .$$

The orbital state

$$\left| \begin{array}{ccc} b_1 & b_2 & b_3 \\ L & \gamma & M \end{array} \right\rangle$$

belongs to the IR

$$[b_1, b_2, b_3] \text{ of } U_3$$

$$L \text{ of } O_3$$

$$M \text{ of } O_2$$

The extra label  $\gamma$  distinguishes between states in which a given  $L$  appears more than once in an  $U_3$  multiplet.

TABLE II

$O_3$  irreducible representations ( $L$ ) contained  
in  $[b_1, b_2, 0]$  of  $U_3$

| $b_1, b_2$ | $L$ | $b_1, b_2$ | $L$     | $b_1, b_2$ | $L$                     |
|------------|-----|------------|---------|------------|-------------------------|
| 1 0        | 1   | 4 0        | 4,2,0   | 3 2        | 3,2,1 <sup>-</sup>      |
| 2 0        | 2,0 | 3 1        | 3,2,1   | 6 0        | 6,4,2,0                 |
| 1 1        | 1   | 2 2        | 2,0     | 5 1        | 5,4,3,2,1               |
| 3 0        | 3,1 | 5 0        | 5,3,1   | 4 2        | 4,3,2,2 <sup>+</sup> ,0 |
| 2 1        | 2,1 | 4 1        | 4,3,2,1 | 3 3        | 3,1                     |

## RESUMEN

Las matrices de transformación entre las bases de representaciones irreducibles del grupo  $U_3$  clasificado por la cadena de subgrupos canónica  $U_3 \supset U_2 \supset U_1$  y las clasificadas por la cadena orbital  $U_3 \supset O_3 \supset O_2$  se obtienen directamente. Los resultados, para todas las representaciones de orden menor o igual a 6, se presentan en una tabla, como raíces de números racionales.
